

Bell-Cohere Workshop – Handout V3

Build an AI agent for the role, not just the task

Use the username and password on your printed credential sheet. Do not share your credentials.

1. Get started

1. Open bell.democloud.cohere.com.
2. Sign in with your assigned userXXX@bell-workshop.com account.
3. In **Sources** → **My files**, confirm that the workshop guide and sample RFP files are available.
4. Keep **Sanderling Coast.pdf** and **Wrenfell Transit.pdf** available for testing.

2. Build your Proposal Drafter agent

2.1 Create the agent

1. Open **Agents**, then select **+ New agent**.
2. Name it **RFP Proposal Drafter – [YourName]**.
3. Add this description:

Generates an executive summary from an input RFP and evidence from historic RFP responses.

2.2 Add the V3 custom instructions

Paste the following into **Custom instructions**:

Role & Objective

You are the Lead Proposal Writer. Ingest the RFP document (or structured requirements) and write a highly compelling, factually accurate 3-paragraph Executive Summary. Ground your writing strictly in the facts and past winning projects stored in your connected Library. Do not hallucinate or extrapolate.

If the prompt says "UPSTREAM RESEARCH COMPLETE", use only the RFP and Library evidence supplied in that prompt and do not use tools or search the Library again; otherwise follow the Library search step below.

Drafting Process

1. Search the Library for analogous past projects, standard delivery methodologies, and relevant performance metrics.
2. Draft Paragraph 1 (Vision): summarize the client's operational challenges and connect its goals to the proposed solution.
3. Draft Paragraph 2 (Capability): detail the technical approach and cite at least one real past project from the Library.
4. Draft Paragraph 3 (Value):
 - If security, data residency, or sovereignty is requested, focus on compliance, secure architecture, and sovereignty.
 - Otherwise, focus on direct operational value such as reliability, speed, or cost efficiency.
5. End with a two-sentence SME Review Note asking the user to verify key assumptions.

Required Output

Return: Vision & Understanding; Proposed Technical Approach & Proven Capability; Strategic Value & Compliance; and an SME Review Note.

2.3 Connect and publish

1. Under **Add tools**, enable **Document mode**.
2. Select **Sources**, choose **Libraries**, and connect **Past RFP Library**.
3. Select **Publish changes**.

2.4 Test standalone mode

1. Start a chat with your agent.
2. Add **Sanderling Coast.pdf** from **My files**.
3. Prompt:

Draft an executive summary in response to this RFP based on the Library of past responses.

Confirm that the response includes all four required sections and cites Library evidence.

3. Add your agent to the automation

3.1 Duplicate the starter

1. Open **Automations** → **Discover** → **Shared with you**.
2. Select **RFP Automation – Workshop version**.
3. Use the three-dot menu to **Duplicate** it.
4. In **My builds**, rename your copy **RFP Automation – [YourName]**.

3.2 Add and connect the Drafter

1. On the automation canvas, select the blue **+**.
2. Add **RFP Proposal Drafter – [YourName]**.
3. Connect the **if** output of both **Conditional – NoGo Agent** and **Conditional – Review outcome** to your Drafter.

3.3 Use the V3 automation prompt

Paste this prompt into the Drafter node:

UPSTREAM RESEARCH COMPLETE

Extracted RFP requirements:

```
{{ results.node-2cfd8wkb.output.text }}
```

Library evidence from Go/No-Go:

```
{{ results.node-SoP7zpAY.output.data.Justification }}
```

Capability Match Score:

```
{{ results.node-SoP7zpAY.output.data["Capability Match Score"] }}
```

Draft the executive summary now from this supplied context.

This marker activates V3 automation mode: the Drafter reuses the evidence already gathered upstream instead of searching the Library again.

3.4 Configure the output

1. Open the automation settings using the cog icon.
2. In the output template, replace the placeholder Drafter connection with **RFP Proposal Drafter – [YourName]**.

4. Test and publish

1. Select **Test**.
2. Add **Wrenfell Transit.pdf** or **Sanderling Coast.pdf** from **My files**.
3. Select **Run Test**.
4. At human review, confirm the recommendation and continue.
5. Verify the output contains:
 - a GO/NO-GO recommendation with three reasons;
 - six prioritized risks; and
 - all four executive-summary sections.
6. Close the test panel, select **Publish**, and add version notes.

5. Optional: run from Discover

1. Open **Automations** → **Discover** and select your automation.
2. Add one of the sample RFP files.
3. Select **Run**.
4. Open **Runs** to monitor execution and inspect the final output.

V3 reference assets

Use these company-wide production assets to compare your completed build:
